

P-E-02 and P-SC-02: A63 Ellerker and South Cave

The A63 merits distinct consideration from the wider flood issues.

As well as rapidly discharging in storms and potentially having diffuse pollution impacts upon downstream watercourses in normal rainfall, it is itself vulnerable to flooding in extreme events (e.g. June 2007, see right).

Therefore, it is worth considering whether surface water improvements beyond the highway boundary can improve its resilience and reduce its impacts.
